What is the Sambolo and represents? the activation energy 9. What does the Sambolo and represent? The complex activated the curve in the diagram? 8. What is the quamic structure identified at the top of the exotic or exotic exotic endothermic? 7. What kind of reactions is represented by this diagram, use the energy diagram for methyl isonitrile reaction to acetonitrile to answer the following questions. mol/l s is the change in the concentration of a reagent or product per unit of time. It can be expressed using the units of (6) (5) to form the activated complex is (4) activation energy. In a quomnic reactions, the reaction requires energy, and the mother's amount of energy that reagent particles must have this fanic arrangement is known as (3) arrangement of ãthos that can form products or separate to reform the reagents. According to (1) Energy Quinomics: The theory of the Mattanal and the Change of COLLISION, "Mollets must collide to react. Once formed, the (2) activated complex is a theory of temporary and utter activated complex collision, use each of the terms below only once to complete the passage. How would the reaction differ if the steel wool was not heated? No. A steel block would react more slowly because it has less surface area. Steel wool? Explain your answer. Eight. The chemist would have observed the same results if he used a steel block instead of the concentration of a reagent increases the rate of a reaction. There was a higher concentration of oxygen in the container. Increasing it also warmed a sample of steel wool in a container of almost 100% oxygen. The Steelwool sample in the container reacted faster than the other sample. Explain why. 7. A chemist warmed a sample of steel wool in a flame of burner exposed to oxygen in the air.
